

Redrob Platform & Ecosystem Integration

Aligning **EMMA's local-first self-healing agent fleet** with Redrob's recruitment assessment pipeline.

Q1 & Q2: Capabilities

Q1: Which existing Redrob capabilities are being leveraged?

Leveraged Infrastructure

EMMA integrates directly with Redrob's candidate coding assessment platform and test-runner environment, hooking seamlessly into the existing developer evaluation pipeline.

Q2: What new capability does your solution introduce?

New Capabilities Introduced

A local-first, self-healing developer agent fleet that introduces **AST-level execution sandboxing** and **evolutionary code mutant selection** to automatically run, test, and repair code submissions.

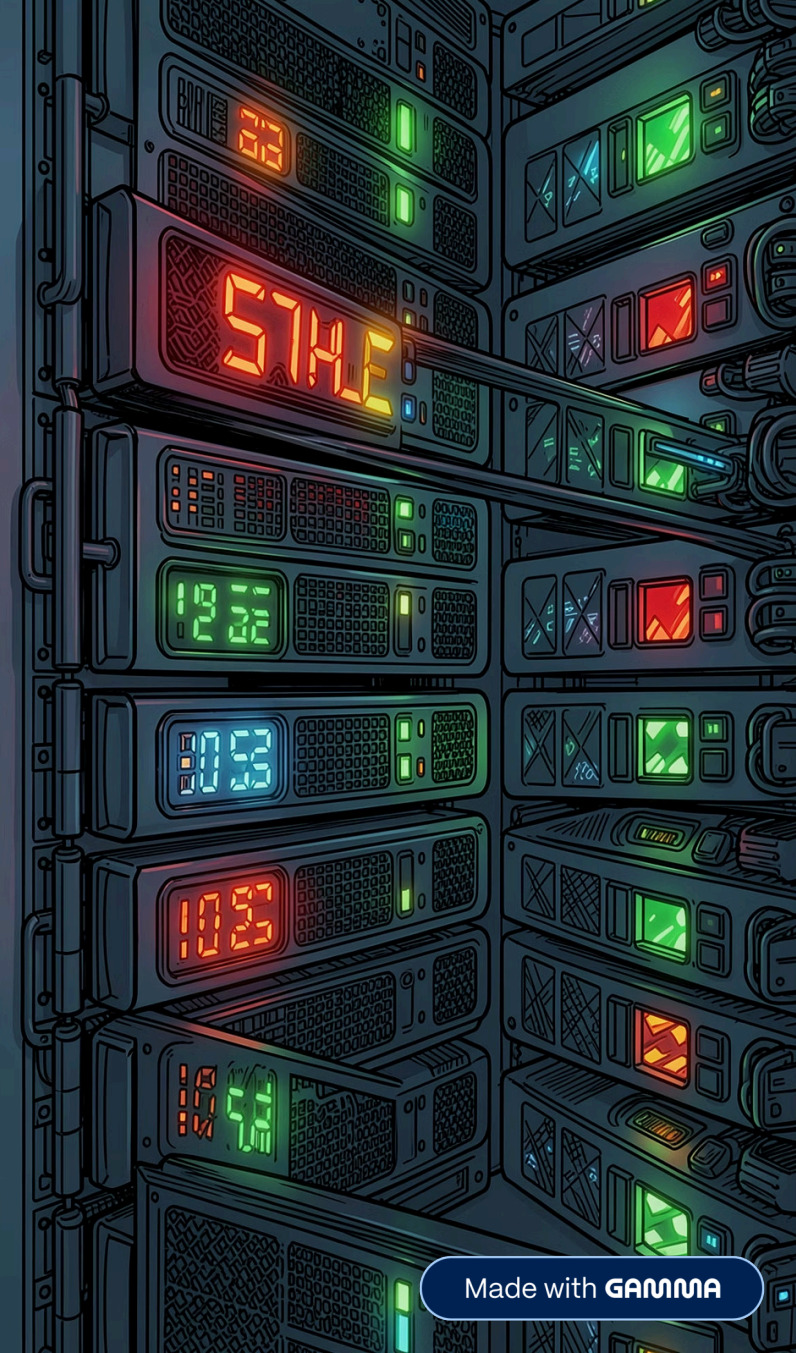

Q3 & Q4: Ecosystem Strengths & Opportunities

Q3: How does it strengthen the overall Redrob ecosystem?

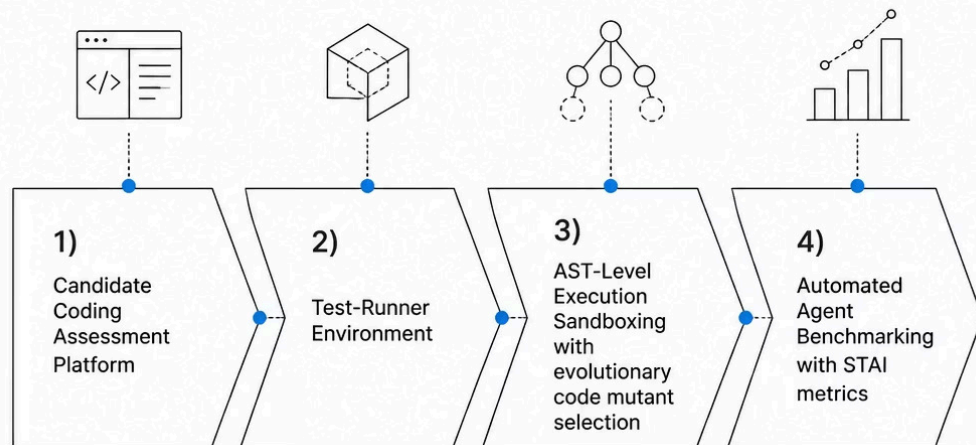

Protects Redrob's host servers by blocking runaway infinite loops in under **1ms**, while running entirely locally to reduce assessment API execution costs to **\$0**.

Q4: What additional opportunities become possible?

Enables automated, high-fidelity **candidate agent benchmarking**, self-healing test suite generation, and deep structural reviews of candidate code submissions using **STAI metrics**.

Integration Visual

End-to-End Pipeline

EMMA hooks directly into Redrob's existing developer evaluation infrastructure — from candidate submission through automated testing, self-healing, and structural code review.

- Seamless integration with existing test-runner environment
- Local-first execution eliminates API costs
- Sub-1ms infinite loop protection for host servers
- STAI-metric-driven candidate code analysis
